ASSET MANAGEMENT:- LIFE SAFETY EDITION

James Elliott
Varciti Limited
6/1/2021

What is the current situation of your assets at your sites?

It's not the most exciting thought to be wondering over your morning coffee, and let's be honest, with how most people manage this data it is a scary thought to have to sit and collate it, but with more and more requests received daily from our clients over:

“What have I got here or there?”

“When is this due for replacement?”

“How much do I need to budget for replacements?”

Is it something you can ignore for any longer, or should **you** act today?

Having that information at the touch of a button must seem like a wishful thought, knowing its accurate a fantasy, being able to respond without digging through hundreds of engineer dockets a pipe dream right?

Why should it be that way, completing asset information should be easy, accurate and available to you when you need it, with analysis for you as standard.

Asset management is a pain, collecting it time consuming, ensuring its up to date a mammoth task, or so it used to be for us.

But now we complete it in real-time, during a service and can be completed anywhere. Find out some good practices in the 5 steps below that you can employ and we now utilise to the benefit of our customers

Don't let the thought of this challenge scare you away, use the systems available to enhance your business.

Visit esmma.co.uk to find out how simple life can be today.

Implement a Life Safety asset and Job management system

Ugh! Process. Not a word many will love. However, having a process in place to track and manage all your assets and job management has many benefits. Think about how much easier it would be to make purchasing decisions and manage lifecycle requirements. Not to mention cut down on maintenance costs, reduce the number of unused assets and give your customers up to date details of all their inventory. Have all your engineers work more efficiently ensuring they have all the parts they need before attending the Job.

Your inventory management process should document the complete life cycle of each asset you sell or support. These are all the phases of an asset's life from acquisition through maintenance and eventual disposal.

LIFE SAFETY ASSET LIFE CYCLE

In addition to the life cycle stage, your process should:

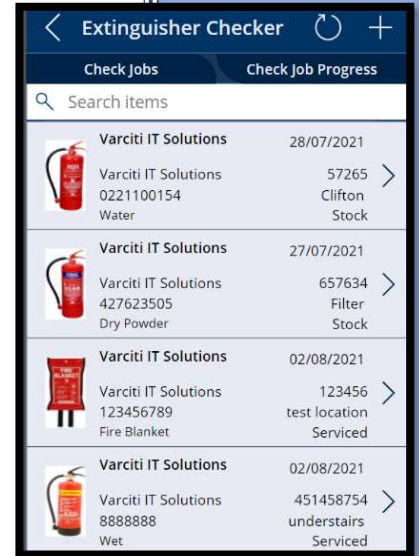

- Track the exact location of every asset at any point in time, from the moment it's sold to a client, returned to you, right up to the time it's retired.
- Record a history of changes/services the asset has been through.
- Document scheduled maintenance and issue certifications.

When done right, your Asset management process will help your team discover, manage, analyse, and report on all your assets.

2

Track assets with our cloud-based system

With fire and security inventory spread around at multiple locations, keeping tabs on it all can quickly become a nightmare. And if you aren't keeping tabs on it, it could be leading to poorly maintained systems and breaking the law. A centralised inventory management solution lets you track your products and provides real-time information of current stock levels, regardless of where they are stored, which reduces the likelihood of stock shortages, unnecessary orders or reorders, and a big negative effect on your customers experience, not to mention your bottom line.

3

Use mobile apps to enhance compliance and auditing needs

If your fire and security contractors management software isn't mobile-accessible, you might not be working as efficiently as possible. Keeping track of materials used while servicing a requires meticulous record-keeping by sales and/or field technicians. Real-time inventory is crucial to eliminate oversights, not to mention prevent shrinkage and costly revisits. Having a mobile platform allows engineers access via their phone or tablet instead of having to take hand-written notes that could blow away or get lost along their service route and worse lost in the van in the weeks leading up to their return to the office.

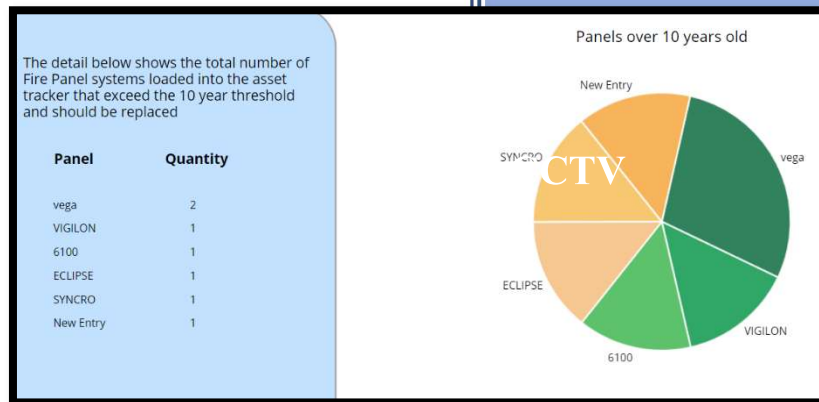

4 Improving customer service with accurate reporting.

The only thing worse than having too much inventory is not having enough to service our customers.

Having access to accurate reports can improve inventory control, which means time to deliver on orders stays low. Plus, we ensure your most-used assets are always stocked and we keep you happy and compliant. Not to mention, proper reports are key to providing you the insight to

maximise investment, reduce downtime, and decrease lost productivity and support costs.

A solution that provides accurate reporting of your inventory will help you keep track of use, current levels, and items on order, as well as provide alerts when certain items hit a predetermined minimum or maximum.

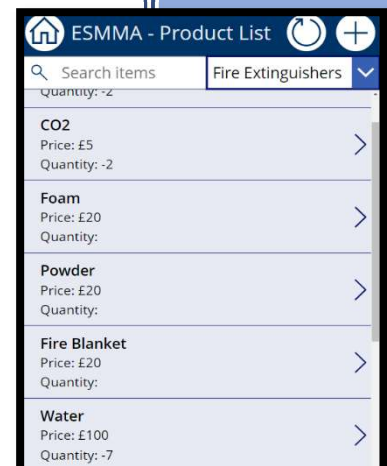

45% of organizations track assets on a project-by-project basis, such as a tender review, but never stop to fully analyse the data.

5 Protect your costs and enable effective budgeting

The best way to make a savings from inventory is to ensure that it's maintained and replaced at appropriate times. Maximising your inventory data is a crucial component of building a successful lifecycle strategy.

Tracking cost change and monitoring inventory use also gives you the ability to wisely take advantage of special offers from suppliers and to utilise promotions and discounts.

Managing your inventory doesn't have to be overwhelming.

ESMMA's all-in-one platform, built specifically for Fire and security providers, combining inventory management, servicing and certification, job scheduling billing and more. Get real-time, accurate information at any given time and turn simple life safety asset management into a data gold mine that will show you how to calculate ROI and reduce waste and excessive cost by revealing areas of lost revenue.

Track customer assets

Easily manage your assets, when they were installed, last serviced, need replacing or answer call out questions from any location.

Improving customer service

Provide look ahead reporting of items due for replacement and allow our clients to budget for future spend.

Reduce costly revisits for clients by arriving prepared for the days service with all your required equipment in hand.

Boost engineer's workflow

Get your suppliers to track time to serve on sites and allows you to build accurate models for future tenders opportunities. With a complete asset list across the site engineers need never miss an item to service, or struggle to find its location again.

Reduce lost inventory

Track stock levels, including those in stores and ensure you only have on the shelf what you will need, crucially when you need it.
